

DC OWNERS MANUAL

WWW.LIFTTECHMARINE.COM

Operating the DC Motor:

When the lift is going “up” the gear head should be going clockwise. When the lift is going “down” the gear head should be going counterclockwise. If it is going the opposite direction this means your lift was let down too far and now your lift is backwound. To fix this, let the lift down, when it runs out of cable it will wind itself up correctly and start going up. If you have a remote control and the lift is going down while pressing up or going up while pressing down this is the reason why. Please follow the steps above to fix it.

Pendant:

We offer an optional 15-foot or 20-foot pendant that can be purchased and plugged directly into your motor.

Off-Season Storage:

We recommend our storage cover for your motor if you are going to leave it sit outside during the winter months. Our storage cover will breathe and let moisture out while your not using your motor. If you decide to cover the motor with a bag instead, make sure not to seal it completely or condensation can develop and the warranty will be void.

Power Outage:

In case of a dead battery, use the provided back up bit on the end of the shaft with your drill. Visit our website to watch a video on how to use the back up bit.

Power Requirements:

Our DC Motors can be 12 volts or 24 volts.

If running 24 volts make sure to hook your batteries up in a series. (See image on right)

We recommend 24 or 27 series deep cycle batteries.

Maintenance:

Our motors are self-lubricating and do not need any maintenance.

Solar Panels will evaporate water so make sure to check water levels in the battery to prevent battery damage and possible battery explosion. We recommend all solar panels use a charge control to prevent over charging. They can be purchased separate.
